

One OpenAI update this week
has nothing to do with
chatbots.

Everyone is reading it as a safety story. That is the smaller part.

OpenAI's 7 October post is about teaching teenagers to use AI as a **daily tool**, not a toy.

That means the people who will fill your lead forms in five years are learning AI first, search second.

Today a buyer types your product name into Google. Soon they may just ask an assistant to find it.

Your landing page, your ad copy, your form — all built for someone typing keywords by hand.

Nobody knows yet what an AI-first buyer does to cost per lead or conversion rate.

But you can check one thing this week:
how many of your form leads come from
someone clearly reading, not just tapping
through.

Open your lead form questions. Count how many need a real answer versus a pre-filled tap.

That ratio is your form's readiness for a buyer who thinks before they click, not just one who scrolls fast.

This change won't hit your ad account tomorrow. It will hit whoever didn't check their form today.
