

GPT-6 builds your screen. It still
can't open your Ads Manager.

Everyone will cover the launch. Almost nobody will cover what it changes for you on Monday.

"Intelligent UI" means the interface **rewrites itself** around your question, in real time.

A smarter chat window can summarise your campaign. It cannot click into your ad set for you.

WHERE IT ACTUALLY LIVES

Your Performance goal lives inside the ad set, not in any chat window.

Set it wrong — say, to Conversations when you meant Purchases — and no AI flags it.

GPT-6 can write you a sharper ad in seconds. It cannot read your Ads Manager account for you.

A faster assistant on a wrong setting
just gets you to the wrong answer
faster.

Across nine of our ad accounts, every lead still traces back to **one screenshot** in Meta's lead centre.

The tool got smarter. The thing deciding your cost per lead is still a setting **you have to open yourself.**

Use GPT-6 to write faster. Open Ads Manager yourself to check what it's actually optimising for.

Jothi Swaroop.
